1. Product Handling

Implants are provided sterile and should always be stored unopened in their respective protective containers. Prior to use, inspect package for damage that may compromise sterility. If packaging has been opened or damaged upon receipt, contact the manufacturer’s representative. Also inspect the labeling to verify that the expiration date has not passed. If the product is expired, contact Customer Service and do not use the implant. When unpacking the implant, verify the labeling for correct Reference No. and size. When removing the implant from its packaging, the relevant aseptic instructions must be observed. Protect prosthesis from contact with objects that may damage the surface finish. Inspect each implant prior to use for visual damage. This implant is part of a system and should be used only in combination with other original DJO Surgical® product belonging to the same hip system, unless otherwise specified.

DJO Surgical® Hip stems can be used with any DJO Surgical® femoral heads for total joint replacement. DJO Surgical® Hip Systems are for total hip replacement except for Bipolar and Unipolar which are for hemi arthroplasty applications. The CLP Offset, and CLP-R hip systems are for either total or hemi applications.

The FMP system is compatible with the femoral heads and hip stems listed above.

FMP Hemispherical Acetabular Shells (with or without holes, 3D Matrix or P2 coating) | Cementless | Ti6Al4V Alloy | ASTM F136 / ASTM F1472 | ISO 5832-3 |
FMP Faxed Acetabular Shells (with or without holes, 3D Matrix or P2 coating) | Cementless | CP Ti porous coating | ASTM F67 | ISO 5832-2 |
FMP Hemispherical Spiked Acetabular Shells | Cementless | Ti6Al4V Alloy | ASTM F136 / ASTM F1472 | ISO 5832-3 |

The following femoral heads and titanium sleeves are compatible with all hip stems listed in the previous table and with all acetabular liners below.

The following FMP acetabular liners are compatible with the femoral heads, hip stems and FMP acetabular shells listed above.

FMP Acetabular Liners (Neutral, Hooded, Offset) | Cementless | Medical grade UltraHigh Molecular Weight Polyethylene | ASTM F648 | ISO 5834-1 / ISO 5834-2 |
FMP Constrained Acetabular Liners | Cementless | Medical grade UltraHigh Molecular Weight Polyethylene | ASTM F648 | ISO 5834-1 / ISO 5834-2 |
FMP Constrained Acetabular Liner Locking Rings | Cementless | Medical grade UltraHigh Molecular Weight Polyethylene (Highly Cross-Linked) | ASTM F648 / ASTM F2565 | ISO 5834-1 / ISO 5834-2 |
HXe+ Acetabular Liner (Neutral, Hooded, Offset) | Cementless | Medical grade UltraHigh Molecular Weight Polyethylene (Highly Cross-Linked) | ASTM F648 / ASTM F2565 | ISO 5834-1 / ISO 5834-2 |
Vitamin E UHMWPE (a-tocopheral) | | | ASTM F2695 | |

The EMPOWR Acetabular system is compatible with the femoral heads and hip stems listed above.

EMPOWR Acetabular™ Bone Screws | N/A | Ti-6Al-4V Alloy | AMS4965™ | |

The following EMPOWR acetabular liners are compatible with all femoral heads, hip stems and EMPOWR acetabular shells listed above.

EMPOWR Acetabular™ Liner (Neutral, Hooded, Offset) | Cementless | Medical grade UltraHigh Molecular Weight Polyethylene (Highly Cross-Linked) | ASTM F648 / ASTM F2565 | ISO 5834-1 / ISO 5834-2 |
Vitamin E UHMWPE (a-tocopheral) | | | ASTM F2695 | |

The Bipolar components are compatible with all hip stems and 22 & 28mm CoCr Femoral Heads listed above.

Bipolar Liners (Head) | Cementless | CoCr | ASTM F799 / F-1537-07 | ISO 5832-4 / ISO 5834-1 |
| Medical grade UltraHigh Molecular Weight Polyethylene | ASTM F648 | ISO 5834-2 |

The Unipolar components are compatible with all hip stems listed above and Offset Sleeves listed below.

Unipolar Heads | Cementless | CoCr | ASTM F799 / F-1537-07 | ISO 5832-4 |
The Foundation Hip Offset Sleeve is compatible with the Unipolar Heads and 497-34, 36, 40, 44 Series CoCr Femoral Heads.

Offset Sleeve | Cementless | Ti6Al4V Alloy | ASTM F136 / ASTM F1472 | ISO 5832-3 |

1Use only with Empowr Acetabular System
3. Indications (all hip systems in Section 2 above – unless noted below)
Joint replacement is indicated for patients suffering from disability due to:
- noninflammatory degenerative joint disease including osteoarthritis and avascular necrosis of the natural femoral head;
- rheumatoid arthritis;
- correction of functional deformity;
- femoral fracture.
This device may also be indicated in the salvage of previously failed surgical attempts. The constrained acetabular component is indicated for primary or revision patients at high risk of hip dislocation due to a history of prior dislocation, bone loss, soft tissue laxity, neuromuscular disease, or intra-operative instability and for whom all other options to constrained acetabular components have been considered.

4. Intended Use
DJO Surgical® hip devices are intended for treatment of patients who are candidates for total hip arthroplasty per the indications for use. While hip replacements are not intended to withstand activity levels and loads of normal healthy bone, they are a means of restoring mobility and reducing pain for many patients.

5. Contraindications
Joint replacement is contraindicated where there is:
- infection or sepsis;
- insufficient bone quality which may affect the stability of the implant;
- musculoskeletal, neurological or vascular deficiencies, which compromise the affected extremity;
- skeletal immaturity and cases where there is a loss of abductor musculature, poor bone stock, poor skin coverage around hip joint which would make the procedure unsuitable;
- osteoarthrosis;
- rapid joint destruction or bone absorption apparent on x-raygram;
- pathological conditions of the acetabulum, which would prevent achieving proper range of motion, appropriate head stability, and/or a well-seated and supported smooth articulation of the head within the acetabulum;
- alcoholism or other addictions;
- materials sensitivity;
- loss of ligamentous structures;
- high levels of physical activity (e.g. competitive sports, heavy physical labor);
- pregnancy;
- uncooperative patient or a patient with neuromuscular disorders and incapable of following instructions;
- distant foc of infections.

6. Precautions and Warnings
An implant should never be reused. Although the implant may appear undamaged, previous stresses could create imperfections that may lead to mechanical failure. It is advised to allow new prostheses of current design. Familiarity with, and attention to the surgical technique recommended for this device is imperative for best results. The correct selection as well as the correct seating/placement of the prosthetic implant is extremely important. Malposition may predispose the device to excessive wear and early failure. Use of the largest stem possible is recommended. Only DJO Surgical® Hip System implants, instruments, and trial prostheses should be used. Care must be taken to protect mating surfaces (i.e. tapers) and polished bearing surfaces from nicks and scratches which could become the focal point for failure. Contouring or bending of the implant may reduce its service life and may cause immediate or eventual failure under load. An implant must not be tampered with, as tampering will adversely affect the performance of the implant. Do not implant HA (Hydroxyapatite) coated implants with bone cement.

1. Ceramic femoral heads are only indicated for use with stems during total hip replacement.

Precautions and Warnings Specific to the Constrained Acetabular Liner

Precautions:
1. In order to minimize the risks of dislocation and loosening of the shell-acetabular bone or shell-bone cement interface that may occur when using a metallic shell intended for biological fixation or cemented use only, surgeons should consider providing immediate resistance to tensile forces between the metallic shell and the acetabular bone or bone cement interface through the use of orthopedic bone fixation devices such as bone screws, spikes, screw threads, fins, or other bone fixation devices.
2. To correctly position the metallic locking ring, surgeons should consult the manufacturer’s instructions for appropriate device assembly.
3. Physicians should consider component malposition, component placement, and the affect on range of motion when using modular heads (with sleeves or skirts) and extended liners.
4. Regarding component malposition above, recommendation is to caution physician regarding the malpositioned acetabular components cup and the potential for impingement, premature dislocation and revision.

Warnings
1. Closed reduction of this device is not possible. Patients should be made aware that treatment of device dislocation will require additional surgery.  
2. There may be a failure of the retaining ring.
3. A retaining ring that is placed incorrectly may have a reduced life.
4. Retaining ring failure, which may be due to impingement, fatigue, and/or wear, increases the probability of dislocation.
5. Failure or migration of the retaining ring may require additional surgery.

Precautions Specific to the Revelation Short Stem:
1. Fracture in smaller sized stems is most likely to occur in patients who are young, physically active and/or obese.

CAUTION: Federal Law (USA) restricts this device to sale by or on the order of a physician.

7. MRI Safety
United States:
DJO Surgical® hip systems listed in Section 2 of this document have not been evaluated for safety and compatibility in the Magnetic resonance environment. These devices have not been tested for heating, migration, or image artifact in the MR environment. The safety of these DJO Surgical® components in the MR environment is unknown. Scanning a patient with this device may result in patient injury.

EU and ROW:
Non-clinical testing has demonstrated that JO Surgical®’s Total Hip Replacement is MR Conditional in a 3 T MR environment. A patient with this device can be safely scanned in an MR system meeting the following conditions:
- Static magnetic field strength of 3 Tesla (3 T).
- Maximum spatial field gradient of 5,600 G/cm (56 T/m) for 3 T systems.
- Maximum MR system reported, whole body averaged specific absorption rate (SAR) of 2.0 W/kg (Normal Operating Mode) at 3 T.

3 T RF heating
Under the scan conditions defined above, DJO Surgical®’s Total Hip Replacement System is expected to produce a maximum temperature rise of less than 1.5ºC after 15 minutes of continuous scanning. Caution: The RF heating behavior does not scale with static field strength. Devices that do not exhibit detectable heating at one or shell components in the MR environment is unknown. Scanning a patient with this device may result in patient injury.

3 T MR Artifact
In non-clinical testing, the image artifact caused by the DJO Surgical®’s Total Hip Implant System may extend approximately 6.4 cm from the device when imaged with a gradient-echo pulse sequence in a 3 T MR system.

Note: No other MR field strength is recommended.

Note: For the United States, the TaperFill® Hip Stem has not been evaluated for safety and compatibility in the MR environment. It has not been tested for heating, migration, or image artifact in the MR environment. The safety of this DJO Surgical® hip component in the MR environment is unknown. Scanning a patient with this device may result in patient injury.

Note: For the European Union, the TaperFill® Hip Stem is EMPower Acetabular® System is considered as MRI unsafe.

Note: Patients receiving MRI should be made aware of risks associated with this procedure. This could include the following:
• “The strong, static magnetic field of the MRI scanner will pull on magnetic materials and may cause unwanted movement of the medical device.”

• “The radiofrequency energy and magnetic fields that change with time may cause heating of the implanted medical device and the surrounding tissue, which could lead to burns.”

• “The presence of the medical device will degrade the quality of the MR image, which may make the MRI scan uninformative or may lead to an inaccurate clinical diagnosis, potentially resulting in inappropriate medical treatment.”

8. Preoperative Planning and Postoperative Care

Preoperative planning provides essential information regarding the appropriate prosthesis and likely combinations of components. Use instrument trial components for fit verification (where applicable) and extra implant components for backup. X-ray templates for all sizes of the DJO Surgical® Hip system are available upon request.

Accepted surgical practices should be followed for postoperative care. The patient should be made aware of the limitation of total joint reconstruction. Excessive physical activity and trauma affecting the replaced joint have been implicated in premature failure by loosening, fracture, and/or wear of the prothetic implants. The patient should be cautioned to govern his/her activities accordingly as the risk of implant failure increases with weight and activity levels of the patient.

9. Adverse Effects

1. Accelerated wear of the polyethylene articulating surfaces has been reported following total hip replacement. Such wear may be initiated by particles of cement, metal, or other debris which can cause abrasion of the articulating surfaces. Accelerated wear shortens the useful life of the prosthesis and leads to early revision surgery to replace the worn prothetic components.

2. Metabolism and osteolysis may be implicated from wear debris associated with the use of orthopedic implants.

3. Peripheral neuropathies have been reported following total joint surgery. Subclinical nerve damage occurs more frequently, possibly the result of surgical trauma.

4. Metal sensitivity reactions in patients following joint replacement have been rarely reported. Implantation of foreign material in tissues can result in histological reactions involving macrophages and fibroblasts. The clinical significance of this effect is uncertain, as similar changes may occur as a result of the healing process. In some cases, wear debris can initiate the process of histiocytic granuloma formation and consequent osteolysis and loosening of the implant.

5. Dislocation and subluxation of implant components can result from improper positioning of the components. Muscles and fibrous tissue laxity can also contribute to these conditions.

6. Ring fracture could lead to increased risk of dislocation.

7. Implants can loosen or migrate due to trauma or loss of fixation.

8. Infection can lead to failure of the joint replacement.

9. While rare, fatigue fracture of the implant can occur as a result of strenuous activity, improper alignment, or duration of service.

10. Fracture of the femur can occur while press-fitting (seating) the femoral stem into the prepared femoral canal.

11. Allergic reactions.

Intraoperative and early postoperative complications can include:

- acetabular perforation, or fracture;
- femoral fracture can occur while seating the device;
- damage to blood vessels;
- temporary or permanent nerve damage resulting in pain or numbness of the affected limb;
- undesirable shortening or lengthening of the limb;
- traumatic arthritis of the hip from intraoperative positioning of the extremity;
- cardiovascular insufficiency due to cardiovascular insufficiency due to dislocation of the implant;
- collateral damage or osseous or soft tissue damage due to dislocation of the implant;
- periprosthetic fracture resulting in increased risk of dislocation;
- inadequate range of motion due to improper selection or position of components, by impingement, and calibration.

10. Sterilization

Unless opened or damaged, DJO Surgical® implants are supplied sterile in multiple pouches or barrier blister trays. Upon receipt, check all packaging for punctures or other damage. If during inspection, packaging is found opened or damaged, contact manufacturer or manufacturer’s representative for instructions.

Sterilization of implants other than the Highly Cross-Linked Polyethylene Acetabular Liner and Highly Cross-Linked Polyethylene Acetabular Liner with Vitamin E has been performed by gamma radiation at the maximum dose of 25 kGy to achieve a Sterilant Assurance Level (SAL) of 10^-6. Implants are single-use devices. Trials and other instruments are used to determine sizing before the sterile package needs to be opened. Should the integrity of the original sterile package be lost by being opened, pointed, or torn before implantation in the surgical field, contact manufacturer or manufacturer’s representative for instructions.

Sterilization of the Highly Cross-Linked Polyethylene Acetabular Liner and Highly Cross-Linked Polyethylene Vitamin E Acetabular Liner has been performed by hydrogen peroxide gas plasma to achieve a Sterilant Assurance Level (SAL) of 10^-6. These liners are single-use devices and CANNOT be resterilized. Liner trials and other instruments are used to determine sizing before the sterile package needs to be opened.

Do not resterilize an implant or component that has been opened outside of the surgical field or in contact with or contaminated by blood or other substances. Do not try to clean an implant since standard procedures cannot be relied upon to remove contamination from the implant or component and storage of the implant or component should be avoided.

Instruments are provided nonsterile and should be stored in their original packaging until disassembled and sterilized according to the recommended guidelines found in the DJO Surgical® Instrumentation Instructions for Use.

WARNING: DO NOT resterilize any hip prosthesis distributed by DJO Surgical® (Encore Medical, L.P.) as listed in the following warning if sterile packaging is opened or damaged. Return the implant with respective packaging to DJO Surgical® for inspection and disposition.

WARNING: DO NOT resterilize UHMPE (ultra-high molecular weight polyethylene) implants, Highly Cross-Linked Polyethylene, Highly Cross-Linked Polyethylene Vitamin E, PMMA (polymethylmethacrylate) spacers, HA (Hydroxapitate) coated implants, and ceramic implants.

For further information regarding the use of the DJO Surgical® Hip Systems, contact your DJO Surgical® representative or distributor.

¹This system is not approved for sale in the European Union (EU).

### Indications for Use

**EMPOWR Dual Mobility™ Indications:**

- Noninflammatory degenerative joint disease including osteoarthritis and avascular necrosis
- Rheumatoid arthritis
- Correction of functional deformity
- Treatment of non-union, femoral neck fracture, and trochanteric fractures of the proximal femur with head involvement, unmanageable by other techniques
- Revision of previously failed total hip arthroplasty
- Dislocation risks
- To be used for uncemented applications

### Contraindications

Joint replacement is contraindicated where there is:

- Infection, sepsis, and osteomyelitis;
- Distant foci of infections which may spread to the implant site;
- Rapid joint destruction, marked bone loss or bone resorption apparent on roentgenogram;
- Vascular insufficiency, muscular atrophy, or neumosvascular disease;
- Skeletally immature patients and cases where there is a loss of abductor musculature, poor bone stock, poor skin coverage around hip joint which would make the procedure unjustifiable;
- Uncooperative patient or a patient with neuraglic disorders and incapable of following instructions;
- Osteoporosis;
- Metabolic disorders which may impair bone formation;
- Osteomalacia;
- Alcoholism or other addictions;
- Materials sensitivity;
- Loss of ligamentous structures;

### Preoperative Planning and Postoperative Care

Preoperative planning provides essential information regarding the appropriate prosthesis and likely combinations of components. Use instrument trial components for fit verification (where applicable) and extra implant components for backup.

Accepted surgical practices should be followed for postoperative care. The patient should be made aware of the limitation of total joint reconstruction. Excessive physical activity and trauma affecting the replaced joint have been implicated in premature failure by loosening, fracture, and/or wear of the prosthetic implants. The patient should be cautioned to govern his/her activities accordingly as the risk of implant failure increases with weight and activity levels of the patient.

### MRI Safety Information

The EMPOWR Dual Mobility™ System has not been evaluated for safety and compatibility in the MR environment. It has not been tested for heating, migration, or image artifact in the MR environment. The safety of the EMPOWR Dual Mobility™ System in the MR environment is unknown. Scanning a patient who has this device may result in patient injury.

### Trademarks and Patents
